Product Overview & Instructions

Product Overview

Goal Stats is a database-driven women's football analytics application developed by Team Squared. It brings historical FIFA Women's World Cup results, national-team comparisons, hypothetical match predictions, and saved analytics into one platform.

PostgreSQL organizes the historical data and stores user-created scenarios and predictions. Users can explore past matches, compare teams, test hypothetical match conditions, and revisit saved results. The application makes women's football data easier to explore and interpret.

How to Use Goal Stats

1. Open the application at https://goal-stats-app.vercel.app/ website. Navigate using Teams, Matches, Predictions, and Analytics.
2. Explore teams. Select Teams and choose two different national teams to compare available ratings, head-to-head results, and historical performances.
3. Browse historical matches. Select Matches and filter Women's World Cup results by competition edition or national team.
4. Create a hypothetical scenario. On Matches, select two different teams and enter team strengths, match minute, scores, possession, and match statistics.
5. Generate a preview. Select Generate Preview to review win/draw/loss probabilities, expected remaining goals, likely scores, and prediction explanations. This does not save a record.
6. Save the result. Select Save new scenario and prediction to store a scenario and its prediction in PostgreSQL.
7. Review or update saved records. On Predictions, reopen saved scenarios to change permitted match statistics, or browse earlier predictions. Updating a scenario does not change its previously saved predictions.
8. View Analytics. From a saved prediction, select View Analytics to inspect match momentum, probability and possession history, expected goals remaining, and saved match states.

Phase 1 Limitations

Goal Stats is a Phase 1 classroom prototype. Historical data and team ratings may be incomplete. Predictions use hypothetical inputs rather than a model trained on the imported historical matches. Live match tracking, historical backtesting, and advanced tournament execution in the frontend are not implemented in this phase.
