Source Code & Executable

Source Code and Deployed Application

- Backend (Flask API, SQLAlchemy models, PostgreSQL schema and migrations): https://github.com/WestiferRobin/goal-stats-service
- Frontend (React / Next.js application): https://github.com/WestiferRobin/goal-stats-app
- Executable (deployed website): https://goal-stats-app.vercel.app/
- Original RoadToTheFinal prototype: https://github.com/Estebansito1/RoadToTheFinal
    - Used for the prediction engine in Backend and concepts of the UI which now serves for “Womens’ World Cup”

Original Development and Extensions

Team Squared extended the earlier RoadToTheFinal football prediction prototype into a database-driven application. Phase 1 additions include a React/Next.js frontend, Flask REST endpoints, a five-table PostgreSQL schema with relational constraints, historical Women's World Cup data import and browsing, editable hypothetical match scenarios, saved predictions and input snapshots, prediction history, Analytics views, automated tests, and cloud deployment. The original prototype's prediction approach was adapted rather than represented as a newly trained model.

AI Assistance and Verification

ChatGPT and Codex assisted with development, debugging, refactoring, testing, technical audits, and documentation. The team reviewed and adapted AI assisted work against application source code, database models and migrations, automated tests, and observed interface behavior. Team Squared is responsible for explaining and defending the submitted implementation.

Phase 1 Scope

The deployed application supports browsing historical matches and teams, temporary prediction previews, and persistent scenarios and predictions. Live feeds, historical backtesting, and advanced tournament execution through the frontend are not claimed as implemented Phase 1 features.
